August 31, 2018

By Hand Delivery

Ms. Lora W. Johnson, CMC, LMMC Clerk of Council Council of the City of New Orleans Room 1E09, City Hall 1300 Perdido Street New Orleans, LA 70112

> Re: In Re: 2018 Triennial Integrated Resource Plan of Entergy New Orleans, LLC <u>Docket No. UD-17-03</u>

Dear Ms. Johnson:

Entergy New Orleans, LLC ("ENO" or the "Company") respectfully submits the Public Version of its September 14, 2018 Technical Meeting Materials in the above referenced Docket. Please file an original and two copies into the record in the above referenced matter, and return a date-stamped copy to our courier.

The confidential information provided on CD included with the Technical Meeting Materials are considered Highly Sensitive Protected Materials ("HSPM") and will be provided to the appropriate reviewing representatives pursuant to the provisions of the Official Protective Order adopted in Council Resolution R-07-432 relative to the disclosure of HSPM. As such, these confidential materials are being sent to the appropriate parties via UPS overnight delivery.

Should you have any questions regarding the above, I may be reached at (504) 576-2984. Thank you for your assistance with this matter.

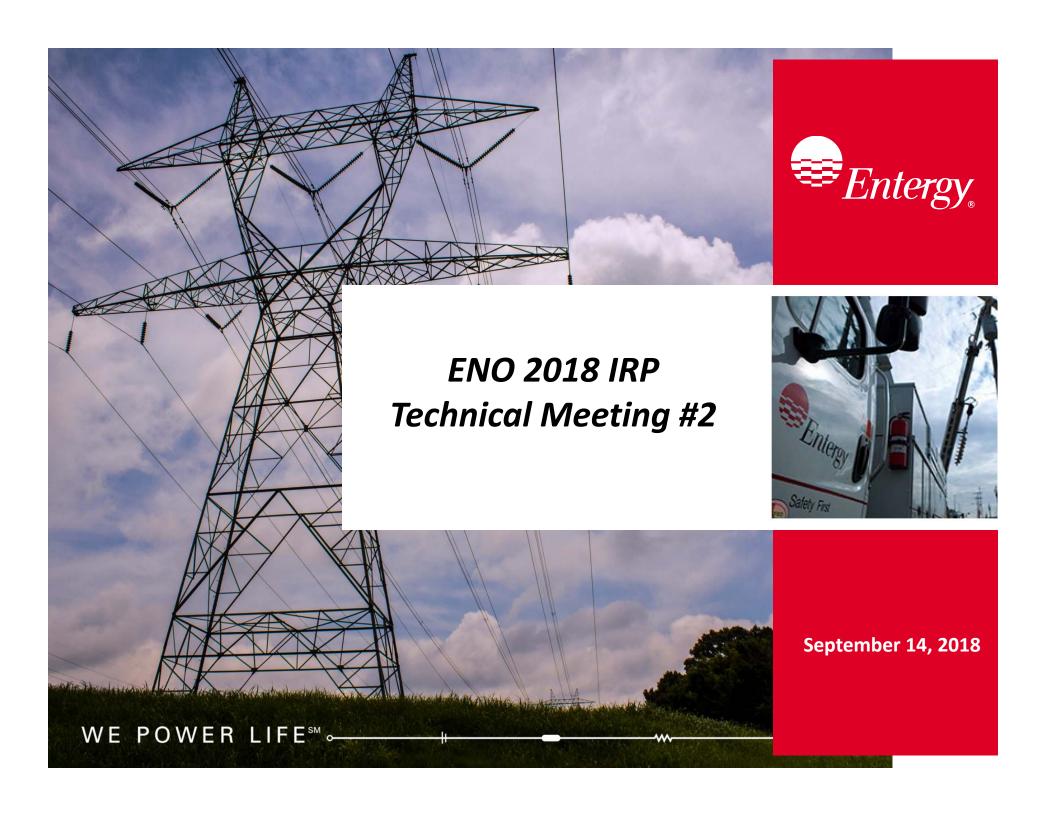

Sincerel

Harry M. Barron

Technical Meeting #1—Follow Ups

Proposed Planning Scenarios

- Add narrative descriptions
- Consider impact of 50/50 renewables-to-gas buildout on LMPs
- Consider CO₂ pricing adjustments to create better range of macro market futures

Proposed Planning Strategies

Propose ideas for Strategy 3 for group discussion

IRP Modeling

Further discussion of portfolio development process

Inputs Workbook

- Produce workbook with relevant IRP modeling inputs
- Transition from BP18U to BP19

Goals and Agenda of Technical Meeting #2

Goals

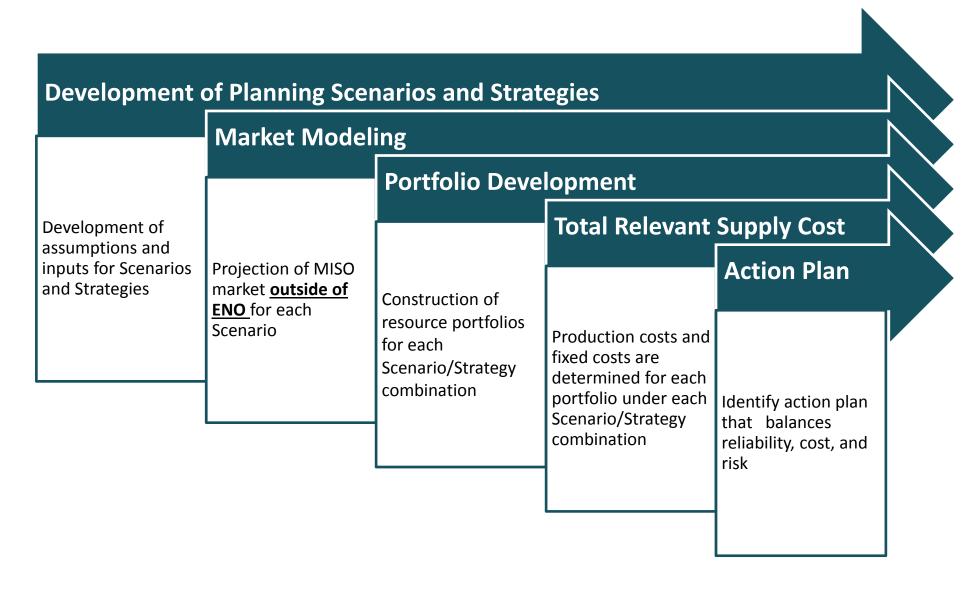

- As described in the Initiating Resolution (R-17-430), the main purpose of this meeting
 is for ENO, the Advisors, and Intervenors to attempt to reach consensus on the
 Scenarios and Strategies that were initially discussed in Technical Meeting #1 (and
 which have been refined as described in this presentation), or
- To discuss the Planning Scenario and/or Strategies that have been prepared by the Intervenors and provided to the parties in advance of this Technical Meeting

Agenda

- Analytical Framework and Portfolio Development
- 2. ENO Capacity Need and Supply Alternatives
- 3. IRP Inputs and Assumptions
- 4. Timeline and Next Steps

Section 1 Analytical Framework and Portfolio Development

Analytic Process to Create and Value Portfolios

Development of ENO Proposed Planning Scenarios – Update

MISO Market Outside of New Orleans

- Aurora market model testing has shown negative Locational Marginal Prices (LMPs), over an extended period of time as a result of the 50/50 renewables-to-gas market additions originally proposed for the MISO market
 - These negative LMPs could result in the suppression of renewable resource additions in portfolios designed for ENO
 - Because it is not realistic to expect the MISO market to experience negative LMPs over an extended period of time, it was necessary to reconsider this assumption
- Based on this testing, two of the three Scenarios proposed at Technical Meeting #1 were modified as shown on following slide:
 - To mitigate the impact that negative LMPs would have on the results and to encourage a range of market prices, ENO:
 - Adjusted the second Scenario to reflect a 25%/75% renewables-to-gas mix for MISO Market additions, and adjusted the CO₂ pricing assumption
 - Adjusted the third Scenario to incorporate battery deployment to address the possibility of negative LMPs due to the 50/50 renewables-to-gas addition assumption
- This helps ensure that the market model doesn't preclude any resource type because of negative LMPs

ENO Proposed Planning Scenarios – Assumptions

	Scenario 1 (Moderate Change)	Scenario 2 (Customer Driven)	Scenario 3 (Policy Driven)
Peak Load & Energy Growth	Medium	Low	High
Natural Gas Prices	Medium	Low	High
Market Coal & Legacy Gas Deactivations	60 years	55 years (Modified from 50 years)	50 years (Modified from 55 years)
Magnitude of Coal & Legacy Gas Deactivations ²	12% by 2028 54% by 2038	31% by 2028 88% by 2038	54% by 2028 91% by 2038
MISO Market Additions Renewables / Gas Mix	34% / 66%	25% / 75% (Modified from 50%/50%)	50% / 50%
CO ₂ Price Forecast	Medium	Low (Modified from High)	High (Modified from Medium)

- 1. Highlighted cells indicate a change since Technical Meeting #1
- 2. "Magnitude of Coal & Legacy Gas Deactivation" driven by "Market Coal and Legacy Gas deactivation" assumptions (e.g. 55 Years; 31%/88%) and were likewise swapped between Scenarios 2 and 3. Percentages based on BP18U; to be adjusted for BP19

Proposed Scenario Purpose and Drivers

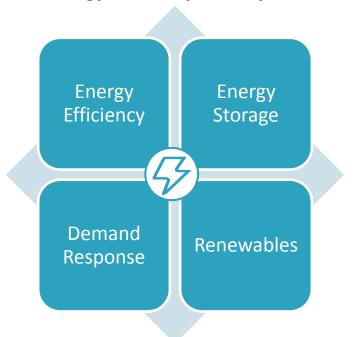

IRP analytics rely on macro market Scenarios designed to allow for the assessment of the total production cost and risk of resource portfolios across a reasonable range of possible future outcomes. The three proposed Scenarios for the ENO 2018 IRP are:

Scenarios	Key Drivers
Scenario 1 (Moderate Change Over Time)	 Flat/declining usage per customer (UPC) in residential and commercial sectors due to increases in energy efficiency and other customer adopted measures UPC declines partially offset by industrial growth and growth in residential and commercial customer counts Renewables and gas replace retiring capacity to promote fuel diversity in long-term resource planning
Scenario 2 (Customer Driven Change)	 Low peak load growth and natural gas prices tied to slumping demand Growth rate of residential and commercial demand and energy usage decreased due to strong customer preferences for EE and DERs Capacity additions in the MISO market are weighted towards gas-fired generation due to low gas and CO₂ prices
Scenario 3 (Policy Driven Change)	 Growth rate of residential and commercial customer demand and energy usage increased through economic development and moderated energy efficiency gains Political and economic pressure on coal and legacy gas plants accelerates retirements High CO₂ pricing along with economic factors drive the replacement of retiring capacity with portfolio of equal amounts of renewables complemented with battery storage and gas-fired technology to replace retiring capacity

ENO Proposed Planning Strategies— Update

Proposed Strategy 3: Solar, Storage, and DSM Alternative

- Policy-driven strategy under which capacity needs are met through a diverse array of solar, battery storage, and DSM
 - Solar: Added to meet energy needs throughout planning horizon
 - Energy storage: Will be explored to help meet peak load requirements
 - Demand Response and Energy Efficiency Assumption: To be discussed

ENO Proposed Planning Strategies--Assumptions

	Strategy 1	Strategy 2	Strategy 3	
Objective	Least Cost Planning	0.2/2% DSM Goal	Solar, Storage & DSM Alternatives	
Capacity Portfolio Criteria and Constraints	Meet 12% Long-term Planning Reserve Margin (PRM) target using least- cost resource portfolio	Include a portfolio of DSM programs that meet the Council's stated 2% goal	Meet peak load need + 12% PRM target using DSM, solar, and battery resources	
Description	Assess demand- and supply-side alternatives to meet projected capacity needs with a focus on total relevant supply costs	Assess portfolio of DSM programs that meet Council's stated 0.2/2% goal along with consideration of additional supply-side alternatives	Assess demand- and supply- side alternatives to meet projected capacity needs with a focus on adding solar and batteries	
DSM Input Case	Navigant Base	Navigant 2%	To be discussed	

Optimized Portfolio Design

- Two ways to develop portfolios within the constraints of the strategies:
 - (1) Aurora Capacity Expansion Algorithm Portfolios
 - Used to identify least cost portfolios across a range of scenarios to meet the goal of a least cost planning strategy. A portfolio could be developed for each, or a subset of, the Scenarios.
 - (2) Customized Portfolios
 - Used to create policy-driven portfolios where desired outcomes (i.e., selection of particular renewable resources, adoption of aggressive DSM programs) consistent with policy requirements and planning principles would be ensured.
- Production Cost Modeling
 - All portfolios are later tested against all Scenarios in the Aurora Production Cost model in order to calculate the variable supply costs for each portfolio/scenario combination.

Assessment of Each Portfolio Design Approach

	Benefits	Challenges
Capacity Expansion Approach	 Capable of finding least cost portfolios given inputs and constraints 3rd party model-based portfolio development Considers multiple market and cost inputs Simultaneously considers multiple competing constraints Captures intermittent resource attributes Consistent application of algorithm 	 Dependent on and sensitive to changes to inputs in ways that can be unpredictable May not account for qualitative benefits and considerations May not account for all stakeholder preferences Application of constraints without judgment can result in less appropriate resource selection Lack of transparency for validation and explanation of results
Customized Portfolio Development	 Ensures stakeholder preferences are met Enables greater focus on other aspects of the IRP (e.g. sensitivities, stakeholder engagement and feedback) Allows evaluation of alternatives and portfolios Transparency Can utilize non-Aurora software 	 Dependent on input from stakeholders and agreement on assumptions Unlimited possible combinations May not meet all objectives (e.g. traditional "least-cost" portfolio)

Optimized Portfolio Design What type of Strategy? **Least Cost?** Policy-driven? **Strategy Driver Aurora Capacity Aurora Capacity** Customized Design or **Expansion Software Expansion Software Capacity Expansion Process** A portfolio is created that For each Scenario, Aurora Capacity **Expansion creates the least cost** incorporates the policy constraints **Total Fixed** and meets the identified need portfolio of demand- and supply-side Costs resources to meet the identified need (peak load + 12% PRM) (peak load + 12% PRM) **Total Variable Using Aurora's Production Cost Production** Modeling, all portfolios are Costs analyzed in all scenarios Total supply costs (fixed + variable production costs) calculated for all **Total Supply** portfolios/scenario combinations for Costs comparison and analysis Sensitivity Least cost portfolios subjected to **Analysis** sensitivity analysis to examine effects of differing fuel prices, CO2 costs, etc.

- WE POWER LIFE™

13

Optimized Portfolio Design

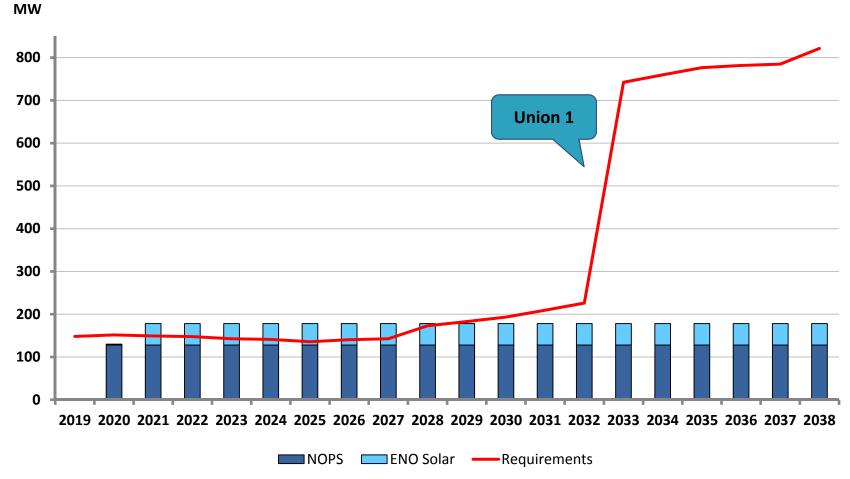

NOTE: All 7 of these portfolios would be tested across the 4 Scenarios in the Production Cost Model, generating 28 Total Relevant Supply Cost Results

Section 2 ENO Capacity Need and Supply Alternatives

ENO's Long-Term Capacity Need

ENO's existing and planned capacity portfolio over the 20 year planning period

Assumptions:

- Requirements based on non-coincident peak and a 12% reserve margin
- ENO Solar additions modeled with 50% effective capacity (100 MW nameplate)

DSM and **Supply Side Resources**

- DSM programs will be evaluated based on the characteristics and attributes provided in the potential studies.
 - Demand Response programs described by an average annual load reduction and annual program costs will be evaluated through spreadsheet models outside of the Aurora model based on capacity value net of fixed program costs.
 - Energy Efficiency programs described by an hourly load reduction profile and annual program costs.
- Programs determined to be economic (i.e. positive net benefits) will be selected in the first year.
 - ENO's capacity position (surplus/deficit) will be adjusted to reflect the capacity contribution of selected Demand Response programs.
- Programs not considered economic in year one will be evaluated by AURORA alongside supply side resources in future years (future program inputs to be provided following initial run).
 - DSM programs with hourly load reduction profiles will be evaluated alongside supply side resources in the portfolio design in order to identify the most economic combination of DSM programs and supply side resources.

Supply-Side Technology Resources

- The supply-side technology assessment analyzes potential supply-side generation solutions that could help ENO serve customers' needs reliably and at the most reasonable cost, including renewables, energy storage, and natural gas technologies.
- ENO's technology assessment for the 2018 IRP explores in detail the challenges, opportunities, and costs of generation alternatives to be considered when designing resource portfolios to meet the capacity needs of customers.
 - Renewable energy resources, especially solar, have emerged as viable economic alternatives.
 - Trend to smaller, more modular resources (such as battery storage) provides opportunity to reduce risk and manage peak demand.
 - Deployment of intermittent generation has increased the need for flexible, diverse supply alternatives. New smaller scale supply alternatives will better address locational, site specific reliability requirements while continuing to support overall grid reliability.

Renewable Resource Assumptions (Solar PV & Wind)

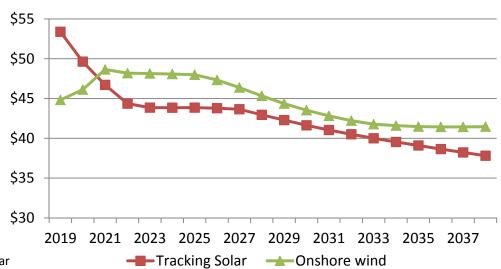

Levelized Real Cost of Electricity (2019\$/MWh-AC) 1

	2019	2020	2021	2022	2023	2026	2029	2032	2035	2038
Solar Tracking ²	\$53.39	\$49.64	\$46.71	\$44.35	\$43.86	\$43.79	\$42.28	\$40.51	\$39.10	\$37.82
Onshore Wind ³	\$44.82	\$46.12	\$48.65	\$48.19	\$48.14	\$47.32	\$44.35	\$42.21	\$41.47	\$41.46

Other Modeling Assumptions

	Solar	Wind
Fixed O&M (2017\$/kW-yr-AC)	\$16	\$36.01
Useful Life (yr)	30	25
MACRS Depreciation (yr)	5	5
Capacity Factor	26%	36%
DC:AC	1.35	N/A
Hourly Profile Modeling Software	PlantPredict	NREL SAM

Levelized Real Cost of Electricity (2019\$/MWh) 1

- 1. Year 1 levelized real cost for a project beginning in the given year
- 2. ITC normalized over useful life and steps down to 10% by 2023 $\,$
- 3. PTC steps down to 40% by 2020 and expires thereafter

Source: The capital cost assumptions for Wind and Solar are based on a confidential IHS Markit forecast.

Grid-Scale Battery Storage Alternatives

As battery storage technology continues to improve it is important to assess the costs and benefits associated with its deployment to meet long-term needs in the proper context.

Battery storage includes a range of unique attributes that should be considered, such as:

- The ability to store energy for later commitment and dispatch (energy and capacity value)
- Ability to discharge in milliseconds and fast ramping capability (ancillary services)
- Potential deferral of transmission and distribution upgrades
- Rapid construction (on the order of months)
- Modular deployment provides potential scalability
- Portability and capability to be redeployed in different areas
- Small footprint (typically less than an acre), allowing for flexible siting
- Low round-trip losses compared to other storage technologies (such as compressed air)

These attributes should be considered in the appropriate context, not all of which is well understood at this time, including but not limited to:

- Batteries are not a source of electric generation
- Useful life can be much shorter than other grid-scale investments (replacement cost)
- Market rules not yet established to govern participation in wholesale markets
- Discharge less electricity than required to charge due to losses
- Cost of environmentally sound disposal

Battery Storage Assumptions

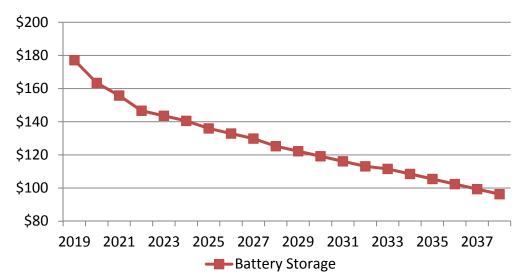

Levelized Real Fixed Cost (2019\$/kW-yr) 1

	2019	2020	2021	2022	2023	2026	2029	2032	2035	2038
Battery Storage	\$177	\$163	\$155	\$146	\$143	\$132	\$122	\$113	\$105	\$96

Other Modeling Assumptions

	Battery Storage
Energy Capacity : Power ²	4:1
Fixed O&M (2017\$/kW-yr)	\$9.00
Useful Life (yr) ³	10
MACRS Depreciation (yr)	7
AC-AC efficiency	90%
Hourly Profile Modeling Software	Aurora
AC-AC efficiency Hourly Profile Modeling	30,0

Levelized Real Fixed Cost (2019\$/kW-yr) 1

- 1. Year 1 levelized real cost for a project beginning in the given year
- 2. Current MISO Tariff requirement for capacity credit
- 3. Assumes daily cycling, no module replacement cost, full depth of discharge

Source: The capital cost assumptions for Battery Storage is based on a confidential IHS Markit forecast.

Technical Meeting Purpose

Technical Meeting	Purpose		
Technical Meeting 1 (January 22 nd)	The purpose of this meeting will be to discuss Planning Scenarios and Strategies. ENO should be prepared to present its Reference (and two alternative) Planning Scenarios, the Least Cost Planning Strategy, and the Utility's proposed Reference Planning Strategy.		
Technical Meeting 2 (September 14 th)	The purpose of this meeting is to either confirm the consensus Scenario and Strategy or to confirm that ENO is prepared to include the Stakeholder Scenario and Strategy pursuant to the discussions of Technical Meeting 1.		
Technical Meeting 3 (November 19 th – November 30 th)	Purpose is to finalize the Planning Scenarios and Strategies by all parties and lock down of all IRP inputs. The results of the DSM Potential Studies will be provided in the input format required for modeling in the IRP. This meeting will also contain the initial discussion of scorecard metrics.		
Technical Meeting 4 (April 22 nd – May 3 rd)	The purpose of this meeting is to review the Optimized Resource Portfolios, finalize the Scorecard Metrics, and conduct an initial discussion regarding Energy Smart Program budgets and savings goals. For this meeting, ENO should prepare initial proposed Energy Smart Program budgets, and savings goals for discussion.		
Technical Meeting 5 (August 28 th – September 11 th)	The purpose of this meeting is to discuss Energy Smart implementation for Program Years 10-12.
